Transition metal oxide

$LiCoO_2$ (LCO) introduced by Goodenough [46] is the first and the most commercially successful form of layered transition metal oxide cathodes. It was originally commercialized by SONY, and this material is still used in the majority of commercial Li-ion batteries. The Co and Li, located in octahedral sites occupy alternating layers and form a hexagonal symmetry (Fig. 4a). LCO is a very attractive cathode material because of its relatively high theoretical specific capacity of 274 mAh g^{-1}, high theoretical volumetric capacity of 1363 mAh cm^{-3}, low self-discharge, high discharge voltage, and good cycling performance [47,48].

The major limitations are high cost, low thermal stability, and fast capacity fade at high current rates or during deep cycling. LCO cathodes are expensive because of the high cost of Co (Fig. 1). Low thermal stability refers to exothermic release of oxygen when a lithium metal oxide cathode is heated above a certain point, resulting in a runaway reaction in which the cell can burst into cycling (delithiation above 4.2 V, meaning approximately 50% or more Li extraction) induces lattice distortion from hexagonal to monoclinic symmetry and this change deteriorates cycling performance [52]. Many different types of metals (Mn, Al, Fe, Cr) [53–56] were studied as dopants/partial substitutes for Co and demonstrated promising but limited performance. Coatings of various metal oxides (Al_2O_3, B_2O_3, TiO_2, ZrO_2) [57,58] were more effective in enhancing LCO stability and performance characteristics even during deep cycling, because mechanically and chemically stable oxide material could reduce structural change of LCO and side reactions with electrolyte.

$LiNiO_2$ (LNO) has same crystal structure with $LiCoO_2$ and a similar theoretical specific capacity of 275 mAh g^{-1}. Its relatively high energy density and lower cost compared to Co based materials are the main research driving forces. However, pure LNO cathodes are not favorable because the Ni^{2+} ions have a tendency to substitute Li^+ sites during synthesis and delithiation, blocking the Li diffusion pathways [59]. LNO is also even more thermally

What You Don’t Need to Cite

Common Knowledge

General knowledge in the public domain

E.g.: The sky is blue, the sun rises in the east

Field-specific knowledge most in your discipline would agree to be true

E.g.: Photoelectric effect, oxidation happens at the anode

Principles of Referencing

Present your **own** ideas, comments, critiques, or analysis of those ideas

- **Don't** simply cite other's ideas

Building on other's work, create your **own** argumentation

- **Avoid** using a full sentence as direct quote

When citing more than three words:

- Paraphrase
- Direct quotation
- Compounded technical terms are exempted

ALL data you haven't measured yourself must have a reference

- E.g., a melting point

Referencing Methods

Quotation and Paraphrasing Types

Direct Quotation

Paraphrasing

Summarizing

Direct Quotation

Use when:

The precise words used are the best possible way to express the idea and the source is a recognized authority

Most of your paper must be in *your own words*

The quotation must be introduced in the text, it cannot stand alone

The page number must be included in the text body

Least commonly used strategy in STEM

Example of Direct Quotation

Pandit et al.'s (2019) study offers insight into how a construction site's safety climate depends on management's attitude toward it, **indicating**, "The established safety climate and the value assigned to workplace safety can influence whether safety information is exchanged efficiently at the crew level" **(p. 14).**

Signal that a quotation will follow: Name of author and reference to the study

Assertion indicating how the quotation used relates to the point being made

Page number of quotation is listed

Pandit et al, *Int. J. Environ. Res. Public Health* **16**(1) 2019.
NC State University, Technical Communication Videos, https://www.youtube.com/playlist?list=PLR-UWtI0r_GDI8SOgsyTR4rmW_gtprqB6

Paraphrasing

Use when:

Specific details need to be captured, or the source is expected to be used extensively

Paraphrasing expresses the original idea **in your own words**

Paraphrasing is more than just swapping out synonyms
The sentence needs to be restructured

Be selective; only use the most relevant content and ideas

Summarizing

Use when:

The main idea from a source needs to be captured or a **high-level summary** of a certain element is needed

Summaries are the **most common** way in STEM to include source material

Summaries report ideas from a source **in your own words**

After summarizing source material, it looks nothing like the original source

Summaries are generally shorter than the original source

Signaling Words

say	You are simply stating what the author says
claim	You disagree with what the author says
argue	The author is making a subjective argument
maintain	The author still believes it, despite some opposition
point out	The author is giving some factual information
according to	You are simply stating what the author says

Avoiding Plagiarism

Do you need to:

Use the exact wording someone wrote or said?

Quote directly:

When the exact words are important, put them in quotation marks and introduce them in the sentence.

Explain details of an idea or study?

Paraphrase:

Paraphrase to convey ideas and details in your own words while staying true to the original author's intent.

Describe ideas at a high level?

Summarize:

Summarize to provide a high-level overview of a main idea, result, or other important element.

Avoiding Plagiarism

Comparing citation strategies

	Direct Quotation	Paraphrase	Summary
Citations	Must reference the original source (usually author name(s) and year; must include page #)	Must reference the original source (usually author name(s) and year)	Must reference the original source (usually author name(s) and year)
Phrasing	Uses the author's exact original words	Written in your own words	Written in your own words
Content	Provides exact language from original source	Provides details of an idea	Provides a high-level overview of a main idea
